1.1	Basic CSS	2
1.1.1	How to Select which elements to style	2

Chapter 1

HTML and CSS Basics

This chapter mainly covers the [freeCodeCamp](#) tutorials around Responsive Web Design.

1.1 Basic CSS

1.1.1 How to Select which elements to style

Selectors

Selectors can be used to apply CSS styling to all elements of a specific type. This is done through writing the ELEMENT_TYPE followed by a list of styling options encased in curly brackets.

```
ELEMENT_TYPE {  
    STYLING  
}
```

Listing 1.1: "CSS Element type styling example"

Classes

CSS Classes are defined through adding a dot . in front of CLASS_NAME. They can be used for styling several different element types the same way. They are selected by adding the "class" attribute to an HTML element.

```
.CLASS_NAME{  
    STYLING  
}
```

```
<ELEMENT class="CLASS_NAME"></ELEMENT>
```
